Abstract:

Submitted herewith is an Abstract:

ABSTRACT

A method for the optimized transmission of multimedia services in mobile communications networks. One device each is placed on either side of the transmission sections concerned. The devices communicate with each other and divide an integrated multimedia data flow into its application-specific data structure, transport the individual segments via transmission channels of the mobile telephone network which have been specially optimized for this particular purpose and then merges the segments to a transparent data flow which is identical to the original one.
